Optimized

Health plans spend thousands of hours every HEDIS season paying abstractors to hunt through 50-page PDFs for evidence of care that is already there - and still miss it. A skipped immunization note. A buried A1C value. A scanned screening result that never gets reviewed. Each missed finding counts as a gap failure for the measure.

Martlet AI eliminates the hunt: our engine reads every page of every chart, highlights the exact sentence containing clinical evidence, and pre-populates data fields - so abstractors confirm rather than discover.

The Problem With Manual HEDIS Abstraction

Humans Miss Evidence

Under deadline pressure, abstractors skip lines, skim pages, and overlook buried clinical notes. A misread immunization entry or an unreviewed lab result counts as a gap failure — even when the care was delivered and documented. A 2–3% miss rate on a large population shifts your Star rating.

Scale Creates Capacity Pressure

As member populations grow, so does the volume of charts requiring careful review. More charts means tighter deadlines and more pressure on already stretched abstraction teams — leaving less room for the thorough, line-by-line review that HEDIS accuracy demands.

The Stakes Keep Rising

HEDIS quality measures represent 25% of the total CMS Star Rating score in 2026. Moving from 3.5 to 4 Stars unlocks quality bonus payments worth millions. The margin is narrow — a handful of missed closed gaps can determine which side of the threshold your plan lands on.

The Martlet AI HEDIS Model – Automated Abstraction

Pinpoint Evidence, Not PDFs

Instead of page-by-page searching, Martlet AI highlights the exact sentence in a 50-page clinical document where evidence of care appears — with source, date, and measure context already loaded for the abstractor. No hunting. No guessing.

200%+ Abstractor Productivity

Abstractors stop hunting and start confirming. Pre-populated data fields, direct page citations, and measure-mapped evidence mean each abstractor reviews in minutes what previously took an hour — with far greater accuracy and less risk of missing buried evidence.

PHI Stays In Your Environment

Deployed on-premise or in your private cloud. No PHI leaves your infrastructure. No third-party access to member records. HIPAA compliant by architecture — and audit-ready from day one.

How It Works – The Automated Retrospective Pipeline

Ingest Clinical Data

EHR notes, lab reports, radiology, discharge summaries, scanned PDFs – ingested at scale with no volume limits.

Extract & Normalize

Healthcare NLP identifies medications, vitals, labs, procedures, and screenings – even from handwritten or scanned notes.

Apply Measure Logic

Each finding is mapped to the applicable HEDIS measure with date logic: 10-yr colonoscopy lookback, 2-yr mammogram, 30-day post-discharge follow-up.

Surface Quality Signals

Measure status (Open / Closed / Needs follow-up), evidence location, confidence score, and recommended action — per member.

Confirm & Submit

Abstractors confirm AI findings. Audit-ready documentation, full evidence trail, structured for HEDIS submission.

Manual Abstraction Model

- ✓ Per-chart cost that grows with member population
- ✓ Evidence missed under time and deadline pressure
- ✓ Growing volume creates deadline pressure and capacity constraints on abstraction teams
- ✓ PHI handled by third-party staff if outsourced
- ✓ Missed gaps invisible until final season score is published

Martlet AI - Automated Abstraction

- ✓ Fixed platform price – cost per chart drops as volume grows
- ✓ No fatigue – every sentence of every chart is reviewed
- ✓ Scale up review volume without straining your team or compromising on thoroughness
- ✓ PHI stays inside your environment – no third-party access
- ✓ Gaps surfaced proactively before the submission deadline

Stars Impact – The Financial Case

Finding just a few more closed gaps per 1,000 members can push a health plan over the threshold between a 3.5-star and 4-star rating. In 2026, HEDIS quality measures represent 25% of the total CMS Star Rating score. A single Star improvement unlocks CMS quality bonus payments worth millions of dollars annually. Martlet AI ensures you are not leaving documented evidence of care undiscovered in your charts.
