

Bring Retrospective Chart Review In-house

Fully Automated.
No Outsourcing.
No Per-Chart Fees.

RADV-Ready

Defensibility First AI

Fixed Platform Pricing

On-Premise Deployment

- **Medicare Advantage plans**

spend \$12–\$15 per chart on outsourced retrospective review — losing control of data quality, audit defensibility, and cost as member populations grow.

Martlet AI gives health plans the technology to bring that entire process in-house, replacing the outsourced vendor workforce with AI that runs continuously, at scale, inside your own environment.

The Problem With Outsourcing Chart Review

Cost That Scales Against You

At \$12–\$15 per chart, a plan reviewing 100k records spends \$1.2M–\$1.5M annually, and that number grows with your population. Outsourced pricing punishes scale.

No Visibility Into Quality

Vendor coders operate as a black box. You have limited insight into how MEAT criteria are applied, which codes are flagged, or whether your audit posture is defensible.

Your PHI Leaves Your Walls

Outsourcing means sending protected health information to a third party. Every handoff creates compliance exposure, a risk that grows with CMS's 2026 RADV audit expansion.

The Martlet AI Model – Insourcing, Automated

AI Replaces the Vendor Workforce

Martlet AI's HCC engine ingests clinical notes, claims, and encounter data and surfaces every valid HCC opportunity, with MEAT-linked evidence, automatically. No outsourced coders required.

Your Data Stays In-House

Martlet deploys forward into your environment, on-premise or private cloud. PHI never leaves your infrastructure. You own the process, the output, and the audit trail.

Your PHI Leaves Your Walls

One flat platform fee regardless of how many charts you run. The more volume you process, the lower your cost per chart, the exact opposite of the outsourced model.

How It Works – The Automated Retrospective Pipeline

01

Ingest at Scale

Pull clinical notes, PDFs, encounters & claims. Process millions of records — no volume limits or extra cost.

02

AI HCC Detection

Martlet identifies HCC conditions with MEAT evidence and flags unsupported codes.

03

Chase List Prioritization

Members ranked by RAF lift potential. Your team focuses only on what moves the needle.

04

Coder QA Interface

Purpose-built QA UI with page-level citations and minimal review time — coders confirm, not discover.

05

Output & ROI

Validated HCC codes, audit-ready documentation, and BI reporting. Full RAF uplift visibility.

Outsourced Vendor Model

\$12–\$15 per chart

- ✓ 100k charts = \$1.2M–\$1.5M/year
- ✓ Cost grows with every new member enrolled
- ✓ PHI sent to third-party vendor
- ✓ Black-box quality, limited audit trail

Martlet AI — In-House Model

Fixed platform price

- ✓ Cost per chart drops as volume grows
- ✓ Unlimited charts, no incremental fees
- ✓ PHI stays inside your environment
- ✓ Full MEAT evidence trail, audit-ready from day one

RADV Audit Readiness – Built In, Not Bolted On

When you bring chart review in-house with Martlet AI, you also own your RADV audit posture. Every HCC suggestion is linked to page-level clinical evidence from day one — making mock audits, evidence packet assembly, and CMS responses a built-in capability, not an afterthought.

Ingest RAD Packets

Member list, dates of service, HCC codes from CMS audit notification.

Validate & Link to MEAT

Validate diagnosis codes, flag unsupported codes, date-of-service validation.

Evidence Packet Builder

Auto-assemble charts with page-level citations, deficiency checklist & fix plan.

Mock Audit Engine

Run mock audits across your entire dataset — proactively find gaps before CMS does
